

User Manual DA16200 DA16600 FreeRTOS SDK Programmer Guide

UM-WI-046

Abstract

The DA16200 (DA16600) is a highly integrated ultra-low power Wi-Fi system on chip (SoC) that allows users to develop the Wi-Fi solution on a single chip. This document is an SDK guide document intended for developers who want to program using the DA16200 (DA16600) chipset and describes the SDK API and peripheral device drivers and interfaces.

2 Introduction

The DA16200 (DA16600) is a highly integrated ultra-low power Wi-Fi system on chip (SoC) that allows users to develop the Wi-Fi solution on a single chip. The user implements the application with the DA16200 (DA16600) SDK, the compile environment is GNU Eclipse IDE system.

2.1 Overview

The DA16200 (DA16600) FreeRTOS SDK has seven folders:

- apps : Project files, source codes for feature configurations
 - apps/common/examples: to demonstrate common use cases of what the DA16200 (DA16600) SDK provides
 - o apps/da16200/get_started/img: to which the images built / pre-compiled are copied

core : source codes

docs : user documents (user guides, programmer guides, etc.)

• library : to which the pre-compiled lib files (.a) are saved

• tools : build tools/ scripts, temporary build artifacts, or environment files

• utility : utility for sample, eclipse and j-link

version : version files to include when Image created

The DA16200 (DA16600) SDK may be provided with different features per customer or per certain applications and Customer/Developer can change the features easily in SDK.

All generic features are defined in

~/FreeRTOS_SDK/apps/da16200/get_started/include/user_main/config_generic_sdk.h (the file name may follow its reference type) where users can enable/disable some features. And detailed features are defined in

~/FreeRTOS SDK/apps/da16200/get started/include/user main/sys common features.h

NOTE

Not all features can be freely enabled/disabled. This depends on the pre-compiled libraries included in the SDK package. Ask Renesas Electronics for more details.

The typical Eclipse project for the DA16200 (DA16600) SDK is shown in Figure 1. There is the possibility to add new user application files to the existing projects or create your own project.

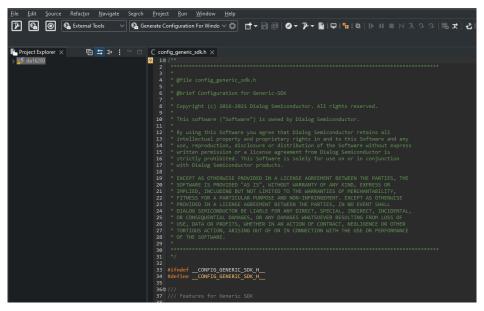

Figure 1: Eclipse Project Configuration

2.2 Development Environment

The DA16200 (DA16600) FreeRTOS SDK needs Eclipse IDE environment. See Ref. [4] for Eclipse installation and Getting Started Guide.

2.3 Startup Main()

After system reboot, the system library invokes function main(). The following steps are run:

- Initialize HW resources (PIN_MUX, RTC, Console ...)
- Start function system_start() to run the DA16200 (DA16600) as Wi-Fi IoT device

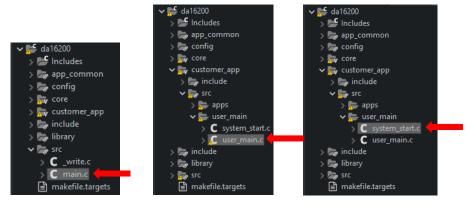

Figure 2: Startup Files on DA16200 (DA16600) Project

```
NULL);
     vTaskStartScheduler();
}
void system launcher( void *pvParameters)
     // Initialize and run system application
    // and run user application if needed.
     start da16x();
     . . .
}
static void start dal6x(void)
{
     /* Configure Pin-Mux of DA16200 */
     config pin mux();
     /* Initialize WLAN interface */
     wlaninit();
     /* Start DA16200 IoT system layer */
     user main(ramlib ptim init status); // USER main
}
```

The following system initialization is done before applications start:

- Configure H/W and S/W features
- Configure system resources for system clock and TX power
- Initialize Wi-Fi function in wlaninit()

```
int user_main(char init_state)
{
    ...
    /* Entry point for customer main */
    if (init_state == pdTRUE) {
        system_start();
    } else {
        Printf("\nFailed to initialize the RamLib or pTIM !!!\n");
    }
    return status;
}
```

After the basic HW resources are initialized, function $system_start()$ is called to run system/user applications. The following happens:

- Start of system-provided applications in start sys apps()
- Start of user applications in start user apps ()

```
[~/FreeRTOS_SDK/apps/da16200/get_started/src/user_main/system_start.c ]
int system_start(void)
```

```
{
    /* Config HW wakeup resource */
    config_user_wu_hw_resource();

    /* Set configuration for H/W button */
    config_gpio_button();

    /* Set paramters for system running */
    set_sys_config();

    /* Initialize WLAN interface */
    wlaninit();

......

    /* Start system applications for DA16XXX */
    start_sys_apps();

    /*
        * Entry point of user's applications
        * : defined in user_apps_table.c
        */
        /* Start system applications for DA16XXX */
        start_user_apps();
}
```

NOTE

The features supported in the SDK are defined in file <code>config_xxxx_sdk.h</code> (namely <code>config_generic_sdk.h</code>) and all features of <code>config_xxx_sdk.h</code> can be enabled/disabled freely.

If the user wants to change more detail features to handle delicate operations, some features in file $sys_common_feature.h$ can be changed, but that requires the support from a support engineer of Renesas Electronics.

2.4 Startup System Applications

After running the main function, the DA16200 (DA16600) SDK runs some system provided applications and user-written applications. Each system application is started by the customer's define features.

Figure 3: Applications on Eclipse Project

The system applications run in two parts:

- Applications that should be executed regardless of network settings
- Application that should be executed after the network setting is completed

```
static void run_sys_apps(void)
    . . . . . .
   /* Create network independent apps */
   create_sys_apps(sysmode, FALSE);
/* Create user's network independent apps */ create_user_apps(sysmode, FALSE);
     /* wait for network initialization */
     while (1) {
            if (check_net_init(iface) == pdPASS) {
                  i = 0;
                   break;
            }
            i++;
            vTaskDelay(1);
     }
     /* Check IP address resolution status */
     while (check net ip status(iface)) {
            vTaskDelay(1);
    /* Create network apps */
    create_sys_apps(sysmode, TRUE);
```

All system applications are provided in the sys_apps_table[] as shown in the example code below:

NOTE

The user does not need to modify the system application tables provided in the DA16200 (DA16600) SDK. If the user does want to modify the system application table, then that is possible but only with the support of a Renesas Electronics Engineer.

2.5 Startup User Applications

After running the main function, the DA16200 (DA16600) SDK can run user-written applications.

The user applications also run in two parts:

Applications that should be executed regardless of network settings

Applications that should be executed after the network settings are completed

```
[ ~/FreeRTOS_SDK/core/system/src/common/main/sys_apps.c ]
void start_user_apps(void)
{
  int sysmode;
  ... ...
```

```
/* Run user's network dependent apps */
    create_user_apps(sysmode, TRUE);
}
```

All user applications can be written in the user_apps_table[] as shown in the example code below. The DA16200 (DA16600) SDK provides a "hello_world" application. (enable __SUPPORT_HELLO_WORLD__ in

~/FreeRTOS_SDK/apps/da16200/get_started/include/user_main/config_generic_sdk.h to use it).

```
[ ~/FreeRTOS_SDK/apps/da16200/get_started/src/apps/user_apps.c ]
const app_task_info_t user_apps_table[] = {
   /* name, func, stack_size, pri, net_flag, dpm_flag, port_no, sys_mode */

#if defined (_SUPPORT_HELLO_WORLD__)
{ HELLO_WORLD_1, customer_hello_world_1, 64, (tskIDLE_PRIORITY +
   2), FALSE, FALSE, UNDEF_PORT, RUN_ALL_MODE },
   { HELLO_WORLD_2, customer_hello_world_2, 64, (tskIDLE_PRIORITY +
   2), TRUE, FALSE, UNDEF_PORT, RUN_ALL_MODE },
   #endif // _SUPPORT_HELLO_WORLD__
   { NULL, NULL, 0, 0, FALSE, FALSE, UNDEF_PORT, 0 }
};
```

- HELLO_WORLD_1
 Not network-dependent, this application starts after system start
- HELLO_WORLD_2
 Network-dependent, this application starts after the Wi-Fi interface is up and running

Figure 4: Results of Running the 'Hello World' Applications

2.6 Write User Application

The user can add new application code in the folder

~/FreeRTOS_SDK/apps/da16200/get_started/src/apps and can add a newly written application file in the project such as hello_world.c. See Figure 5.

Figure 5: Customer Project in Eclipse IDE

The DA16200 (DA16600) SDK provides an interface to add a user application. The interface is designed to create a user thread. For this purpose, define your application with this interface and then a user thread is automatically created and run when the DA16200 (DA16600) starts.

The structure of the application thread information is as shown in the example code below:

```
[ ~/FreeRTOS_SDK/apps/da16200/get_started/include/apps/application.h ]
typedef struct _app_task_info {
    /// Thread Name
    char *name;

    /// Funtion Entry_point
    VOID (*entry_func)(ULONG);

    /// Thread Stack Size
    USHORT stksize;

    /// Thread Priority
    USHORT priority;

    /// Flag to check network initializing
    UCHAR net_chk_flag;

    /// Usage flag for DPM running
    UCHAR dpm_flag;

    /// Port number for network communitation
```

```
USHORT port_no;

/// Running mode of DA16xxx
int run_sys_mode;
} app_thread_info_t;
```

name
 entry_func
 stksize
 priority
 Unique thread name
 Thread entry point
 Stack size of thread
 Thread running priority

- net_chk_flag [DA16200 (DA16600) feature] Indicate if the software must wait until the
 network interface is up and running before the user thread runs. If set to 1, the user thread waits
 until the network interface is up and running. You must set the value to 1 if your program is a
 network application
- dpm_flag [DA16200 (DA16600) feature] [To Be Used Later When DPM feature is enabled TBU_DPM] Indicate if the user thread uses the DPM function
- port_no [DA16200 (DA16600) feature] [TBU_DPM] Data transfer port number for DPM mode. When a user thread has UDP/TCP operation with a specific port number, this port number should be registered to distinguish the data in DPM mode. This port number should be unique in the user thread table
- run_sys_mode [DA16200 (DA16600) feature] Runs a Wi-Fi mode (STA / Soft-AP). The application runs only the specified Wi-Fi mode

NOTE

Do not use malloc() or free() functions to allocate or free memory. To allocate or free memory, you must use pvPortMalloc() or vPortFree() functions.

To add user application code in the DA16200 (DA16600) SDK:

1. Write new user code files and put the files in the customer folder. For example, hello_world.c.

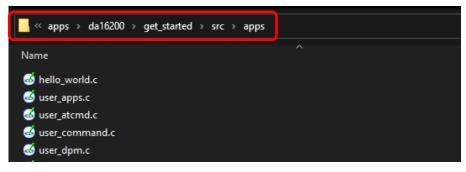

Figure 6: Location of User Codes

2. Add the written user code files to the Eclipse project. See Figure 7.

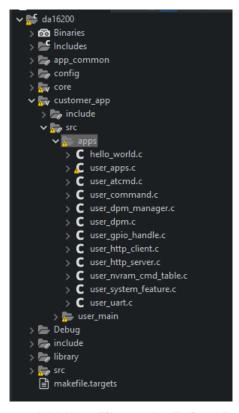

Figure 7: Add User Files to the Eclipse Project

2.7 SDK Compilation

After an application is written, right-click on the project **DA16200 (DA16600)**, and then click **Build Project**. If you compile for the first time, then the advice is to run command Clean first. See Figure 8.

```

Figure 9: Build Success on Eclipse IDE

If the build is successful, then there are two binary images created in folder ~/FreeRTOS_SDK/apps/da16200/get_started/img. The names of the image files are:

RTOS : DA16200_FRTOS-GEN01-01-XXXXXXXXX-000000.img

2nd Bootloader : DA16200 FBOOT-GEN01-01-XXXXXXXXXX-000000 W25Q32JW.img

(In case of Winbond W25Q32JW SFLASH)

For more information about the firmware download, see Ref. [2].

2.8 Make fcCSP Low-Power RTOS Image

The DA16200 (DA16600) SDK provides a QFN-type RTOS SFLASH image file. After a compilation with the DA16200 (DA16600) SDK, the QFN-type RTOS image with filename **DA16200_FRTOS-GEN01-01-XXXXX-000000.img** is created in folder **~/SDK/apps/da16200/get_started/img/**.

To create a RTOS image for the fcCSP Low-Power chipset with the DA16200 (DA16600) SDK, change the files mentioned below, and then do the SDK Compilation instructions given in Section 2.7.

binary file : ~/SDK/library/liblmac.a.fcCSP_LP

> ~/SDK/library/liblmac.a

Compile feature :
 ~/SDK/apps/da16200/get_started/include/user_main/sys_common_features.h
 #undef __FOR_FCCSP_SDK__ > #define __FOR_FCCSP_SDK__

After the compilation, load the RTOS image into the SFLASH and boot the system. To distinguish it from the QFN type, it shows SDK Version information as "V3.2.X.0 CSP LP" when booting. See Figure 10.

Figure 10: Boot Logo with fcCSP-LP RTOS Image

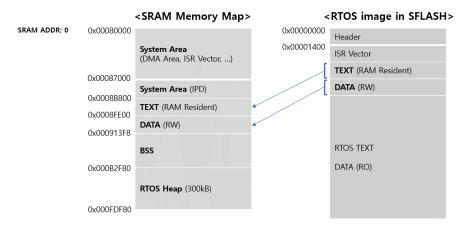

3 Memory Map

3.1 Memory Types

The DA16200 (DA16600) supports Mask ROM, Retention memory, SRAM, OTP, and Serial Flash memory. Mask ROM boots the system and starts the Main image. Retention memory is a special memory to preserve the contents when in power save mode. The DA16200 (DA16600) SoC contains 512 kB SRAM. OTP is used to store some permanent information and its size is 8 kB. A separate document is provided to use the OTP memory.

3.2 SRAM Memory Map

SRAM ADDR: 512KB

Figure 11: SRAM Memory Map

Figure 11 shows the SRAM memory map of the DA16200 (DA16600) FreeRTOS SDK. Depending on the decrease or increase of DATA(RW) or BSS area, HEAP size may change. By default, SDK provides about 300 kB of HEAP for user applications.

The DA16200 (DA16600) supports XIP hence TEXT is directly run in cache area (Serial Flash), but some functions are copied and run in SRAM. See TEXT (RAM Resident).

To get the current memory map info, type in the command in Figure 12.

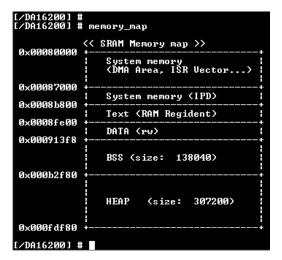

Figure 12: memory_map Command

The end address shown as 0x000F_DF80 can change depending on the variable size of DATA/BSS but less than 0x0010_0000 (512 kB).

3.3 Serial Flash Memory Map

The DA16200 and the DA16600 FreeRTOS SDK support 4 MB SFLASH only.

3.3.1 DA16200

4 Peripheral Driver

NOTE

This document may be further updated with more detailed descriptions later when the DA16200 (DA16600) SLR SoC is available.

4.1 SPI Slave

4.1.1 Introduction

The SPI slave interface enables support to control the DA16200 (DA16600) from an external host. The range of the SPI clock speed is the same as that of the internal bus clock speed. The SPI slave supports both burst mode and non-burst mode. In the burst mode, SPI_CSB remains active from the start to the end of communication. In the non-burst mode, SPI_CLK remains active at every 8-bit.

The communication protocols of the SPI slave interface use either 4-byte or 8-byte control signals. Between the two available communication protocols, the CPU chooses one before initiating the control.

Table 3: SPI Interface API Elements

Din Nama	Pin Number		I/O	Franction Name
Pin Name	QFN	fcCSP		Function Name
GPIOA2	37	B2	I	
GPIOA6	32	E3	I	SPI_CSB
F_CSN	18	J5	I	
GPIOA3	36	D4	I	
GPIOA7	31	E1	I	SPI_CLK
F_CLK	19	K4	I	
GPIOA1	38	C3	I	SPI_MOSI
GPIOA9	29	H2	I	
GPIOA11	27	G1	I

GPIOA0	39	А3	0	
GPIOA8	30	G3	0	SPI_MISO
GPIOA10	28	F2	0	SFI_WISO
F_IO1	15	L7	0	

4.1.2 Application Programming Interface

Table 4: SPI Slave Interface API Elements

void host_spi_slave_init(void)		
Change Slave I/F to SPI protocol. Enable clock to SPI slave device and GPIO Interrupt Set		
void host_i2c_slave_init(void)		
Change Slave I/F to I2C protocol. Enable clock to I2C slave device and GPIO Interrupt Set		

4.1.3 Sample Code

See Ref. [3].

4.2 SDIO Master

4.2.1 SDIO Introduction

Secure Digital Input Output (SDIO) is a full/high speed card suitable for memory card and I/O card applications with low power consumption. The full/high speed card supports SPI, 1-bit SD and 4-bit SD transfer modes at the full clock range of 0~50 MHz. To be compatible with the serviceable SDIO clock, the internal BUS clock should be set to a minimum of 50 MHz. The CIS and CSA area are inside the internal memory and the SDIO registers (CCCR and FBR) are programmed by the SD host.

For more details, see Ref. [1].

4.2.2 Application Programming Interface

Table 5: SDIO Interface API Elements

HANDLE EMMC_CREATE(void);					
Parameter	void	Void			
Ret	urn	If succeeded return handle for such device, if failed return NULL			
Function create	Function create handle. If memory allocation failed, return NULL				
		int EMMC_INIT(HANDLE handler)			
Parameter	handler	Device handle			
Ret	urn	If succeeded return ERR_NONE, if failed return ERR_MMC_INIT			
Initialize the SI	D/eMMC or SDI	O card			
If the function r	eturns ERR_N	ONE, the card information is saved in the handle			
		int EMMC_CLOSE(HANDLE handler)			
Parameter	handler	Device handle			
Return		If succeeded return ERR_NONE			
	int SDIO	_ENABLE_FUNC(HANDLE handler, UINT32 func_num)			
Parameter	handler	Device handle			
	func_num	Function number to enable			
Ret	urn	If succeeded return ERR_NONE			
	int SDIO_DISABLE_FUNC(HANDLE handler, UINT32 func_num)				
Parameter	handler	Device handle			

HANDLE EMMC_CREATE(void);				
func_num		Function number to disable		
Return		If succeeded return ERR_NONE		
int S	int SDIO_SET_BLOCK_SIZE(HANDLE handler, UINT32 func_num, UINT32 blk_size)			
Parameter	handler	Device handle

	blk_size	Block size		
Return		If succeeded return ERR_NONE		

int SDIO_READ_BYTE(HANDLE handler, UINT32 func_num, UINT32 addr, UINT8 *data)				
Parameter	handler	Device handle		
	func_num	Function number		
	addr	Address in the function		
	data	Data pointer		
Retu	rn	If succeeded return ERR_NONE. And byte data is stored in data		
int SD	IO_WRITE_	BYTE(HANDLE handler, UINT32 func_num, UINT32 addr, UINT8 *data)		
Parameter	handler	Device handle		
	func_num	Function number		
	addr	Address in the function		
	data	Data pointer		
Retu	rn	If succeeded return ERR_NONE		
int SDIO_RE	AD_BURST	(HANDLE handler, UINT32 func_num, UINT32 addr, UINT32 incr_addr, UINT8 *data, UINT32 count, UINT32 blksz)		
Parameter	handler	Device handle		
	func_num	Function number		
	addr	Function address		
	Incr_addr	Increase address option (1: address increase, 0: address fix)		
	data	Data pointer		
	count	Count of blocks		
	blksz	Block size		
Retu	rn	If succeeded return ERR_NONE.		
		If failed, Error Code return, see also EMMC.h		
int SDIO_WR	ITE_BURST	(HANDLE handler, UINT32 func_num, UINT32 addr, UINT32 incr_addr, UINT8 *data, UINT32 count, UINT32 blksz)		
Parameter	handler	Device handle		
	func_num	Function number		
	addr	Function address		
	Incr_addr	Increase address option (1: address increase, 0: address fix)		
	data	Data pointer		

int SDIO_READ_BYTE(HANDLE handler, UINT32 func_num, UINT32 addr, UINT8 *data)				
	count	Count of blocks		
	blksz	Block size		
Return		If succeeded return ERR_NONE		

4.2.3 Example Code

See Ref. [3].

4.3 SDIO Slave

4.3.1 Introduction

The GPIO4 and GPIO5 pins are set to SDIO CMD and CLK by default. If SDIO initialization is done and SDIO communication is enabled, then the SDIO data pin setting is done automatically. In other words, when the SDIO communication is detected, the pin used as the SDIO data among the GPIO pins is automatically activated in the SDIO use mode. However, the auto setting function is not supported for the F_xx pin used as the flash function.

Table 6: SDIO Slave Pin Configuration

Pin Name	Pin N	umber	I/O	Function Name
riii Name	QFN	fcCSP		Function Name
GPIOA4	34	F4	I/O	SDIO CMD
F_CSN	18	J5	I/O	SDIO_CMD
GPIOA5	33	D2	I	SDIO_CLK
F_CLK	19	K4	I	3DIO_CLK
GPIOA9	29	H2	I/O	SDIO DO
F_IO0	14	K8	I/O	SDIO_D0
GPIOA8	30	G3	I/O	SDIO D1
F_IO1	15	L7	I/O	SDIO_D1
GPIOA7	31	E1	I/O	6DIO D3
F_IO2	16	J7	I/O	SDIO_D2
GPIOA6	32	E3	I/O	SDIO D3
F_IO3	17	K6	I/O	SDIO_D3

For more details, see Ref. [1].

4.3.2 Application Programmer Interface

Table 7: SDIO Interface API Elements

UINT32 SDIO_SLAVE_INIT(void)				
Parameter Void Void				
Return		return 0		
Description		SDIO Slave Initialization		

	UINT32 SDIO_SLAVE_INIT(void)			
void SDI	O_SLAVE_CALLBAC	K_REGISTER(void (* p_rx_callback_func)(UINT32 status))		
Parameter	p_rx_callback_func	The callback function to use the offload protocol		
R	Return	void		
Des	scription	SDIO Slave callback registration		
	void SDIO_SLAVE_CALLBACK_DEREGISTER(void)			
Parameter	void	void		
R	Return	void		
Des	scription	SDIO Slave callback de-registration		
	vo	id SDIO_SLAVE_DEINIT (void)		
Parameter	void	void		
R	Return	void		
Des	scription	SDIO Slave de-initialization		

4.3.3 Sample Code

See Ref. [3].

4.4 I2C

4.4.1 I2C Master

The DA16200 (DA16600) includes an I2C master module. There are two supportable clock speeds for I2C in the DA16200 (DA16600); standard is 100 kbps and fast mode is 400 kbps.

Table 8 shows the pin definition of the I2C master interface in GPIO Pin Configuration.

Table 8: I2C Master Pin Configuration

Pin Name	Pin Number		I/O	Function Name
riii Naille	QFN	fcCSP		Function Name
GPIOA1	38	C3	0	I2C_CLK
GPIOA5	33	D2	0	
GPIOA9	29	H2	0	
GPIOA0	39	A3	I/O	
GPIOA4	34	F4	I/O	I2C_SDA
GPIOA8	32	G3	I/O	

For more details, see Ref. [1].

4.4.2 I2C Slave

The I2C slave interface gives support to control the DA16200 (DA16600) from an external host.

The pin mux condition is defined in Table 9. The I2C slave interface also supports the standard (100 kbps) or fast (400 kbps) transmission speeds.

Table 9: I2C Slave Pin Configuration

Pin Name	Pin N	umber	I/O	Function Name
rin name	QFN	fcCSP		Function Name
GPIOA1	38	C3	I	
GPIOA3	36	D4	I	ISC CLK
GPIOA5	33	D2	I	I2C_CLK
GPIOA7	31	E1	I	
GPIOA0	39	А3	I/O	
GPIOA2	37	B2	I/O	I2C_SDA
GPIOA4	34	F4	I/O	
GPIOA6	32	E3	I/O	

For more details, see Ref. [1].

4.4.3 Application Programming Interface

Table 10: I2C Interface API Elements

	HANDLE DRV_I2C_CREATE(UINT32 dev_id)				
Parameter	dev_id	Device ID number to create a handle			
Returr	1	If succeeded return handle for the device, if failed return NULL			
Descript	ion	Create a handle with parameter "dev_id" designated			
		Int DRV_I2C_INIT(HANDLE handler)			
Parameter	handler	Device handle to initialize			
Returr	1	If succeeded return TRUE, if failed return FALSE			
Descript	ion				
	int DR\	/_I2C_IOCTL(HANDLE handler, UINT32 cmd, VOID *data)			
Parameter	handler	Device handle to control			
	cmd	See <sys_i2c.h> in our SDK</sys_i2c.h>			
	*data	Data pointer when there is any. If not, NULL			
Return		If succeeded return TRUE, if failed return FALSE			
Description					

int DRV_I2C_IOCTL(HANDLE handler, UINT32 cmd, VOID *data)				
I2C_GET_CONFIG	Get "i2c_cr0" Register Value. See Register Map	Read		
I2C_GET_STATUS	Get "i2c_sr" Register Value. See Register Map	Read		
I2C_SET_DMA_WR	I2C Write via uDMA Tx Enable / Disable	[TRUE / FALSE]		
I2C_SET_DMA_RD	I2C READ via uDMA Rx Enable / Disable	[TRUE / FALSE]		
I2C_GET_DMA_WR	Get uDMA Tx Enabled	[0x2 / FALSE]		
I2C_GET_DMA_RD	Get uDMA Rx Enabled	[TRUE / FALSE]		
I2C_SET_RESET	Set I2C Device Reset / set	[TRUE / FALSE]		
I2C_SET_CHIPADDR	Set I2C Slave Device Address (8 bits)	Write		

	int DR	V_I2C_IOCTL(HANDLE handler, UINT32 cmd, VOID *da	ta)	
I2C_GET_CH	HIPADDR	Get I2C Slave Device Address (8 bits)	Read	
I2C_SET_CLOCK		Set I2C Clock [KHz] (Max = 1200)	Write	
int DR\	/_I2C_WRITE	DMA(HANDLE handler, VOID *p_data, UINT32 p_dlen,	UINT32 dummy)	
Parameter	handler	Device handle to write with DMA		
	*p_data	Buffer pointer to write		
	p_dlen	Length to write		
	dummy	Reserved (set to '0')		
Ret	turn	If succeeded return TRUE, if failed return FALSE		
Desci	ription	I2C write function through DMA		
int DRV_I2C	_WRITE(HAN	DLE handler, VOID *p_data, UINT32 p_dlen, UINT32 sto	ppen, UINT32 dummy)	
Parameter	handler	Device handle to write		
	*p_data	Buffer pointer to write		
	p_dlen	Length to read		
	stopen	Flag stop bit enable		
	dummy Reserved (set to '0')			
Ret	turn	If succeeded return TRUE, if failed return FALSE		
Desci	ription	I2C write function		
int DRV_I2C	_READ(HAND	LE handler, VOID *p_data, UINT32 p_dlen, UINT32 add	r_len,UINT32 dummy)	
Parameter	handler	Device handle to read		
	*p_data	Buffer pointer to read		
	p_dlen	Length to read		
	addr_len	Length of register address inside of slave device. if 0, Re	ead only operation	
	dummy	Reserved (set to '0')		
Ret	turn	If succeeded return TRUE, if failed return FALSE		
Desci	ription	I2C read function		
		Int DRV_I2C_CLOSE(HANDLE handler);		
Parameter	handler	Device handle to close		
Ret	turn	If succeeded return TRUE, if failed return FALSE		
Description		I2C driver close		
	void	DRV_I2C_REGISTER_INTERRUPT (HANDLE handler)	;	
Parameter	handler	Device handle to register Interrupt Handler		
Ret	turn	NULL		
Description		I2C Interrupt Registration		

4.4.4 Sample Code

See Ref. [3].

4.5 SD/eMMC

4.5.1 Introduction

The SD/eMMC host IP has a function for the DA16200 (DA16600) to access SD or eMMC cards. The maximum data rate is less than 100 Mbps. So, this SD/eMMC host IP only supports a 4-bit data bus and the maximum clock speed is 50 MHz. The maximum data rate is 25 MB/s (200 Mbps) under 4-bit data bus and 50 MHz clock speed. The SD/eMMC pin mux condition is defined in Table 11.

Table 11: SD/eMMC Master Pin Configuration

Pin Name	Pin N	umber	I/O	Function Name
rin name	QFN	fcCSP		Function Name
GPIOA4	34	F4	I/O	SD/eMMC_CMD
GPIOA5	33	D2	0	SD/eMMC_CLK
GPIOA9	29	H2	I/O	SD/eMMC_D0
GPIOA8	30	G3	I/O	SD/eMMC_D1
GPIOA7	31	E1	I/O	SD/eMMC_D2
GPIOA6	32	E3	I/O	SD/eMMC_D3
GPIOA10	28	F2	I	CD/oMMC W/DD
GPIOA1	38	C3	I	SD/eMMC_WRP

For more details, see Ref. [1].

4.5.2 Application Programming Interface

Table 12: SD/eMMC Interface API Elements

HANDLE EMMC_CREATE(void)				
Parameter	Void	Void		
Re	turn	If succeeded return handle for such device, if failed return NULL		
Desc	ription	Function create handle. If memory allocation fails, return NULL		
		int EMMC_INIT(HANDLE handler)		
Parameter	handler	Device handle		
Re	turn	If succeeded return ERR_NONE, if failed return ERR_MMC_INIT		
Desc	ription	Initialize the SD/eMMC or SDIO card. If the function returns ERR_NONE, the card information is stored in the handle		
int El	MMC_READ(H	HANDLE handler, UINT32 dev_addr, VOID *p_data, UINT32 block_count)		
Parameter	handler	Device handle		
	dev_addr	Address		
	p_data	Data pointer		
	block_count	Block counter for read		
Re	turn	If succeeded return ERR_NONE		
Description		EMMC read command		
int EM	int EMMC_WRITE(HANDLE handler, UINT32 dev_addr, VOID *p_data, UINT32 block_count)			
Parameter	handler	Device handle		

		HANDLE EMMC_CREATE(void)
	dev_addr	Address
	p_data	Data pointer
	block_count	Block counter for write
Re	turn	If succeeded return ERR_NONE
Desc	ription	EMMC write command
	void EMMC	C_SEND_CMD(HANDLE handler, UINT32 cmd, UINT32 cmd_arg)
Parameter	handler	Device handle
	cmd	SDIO command without response. Defined in <sdio.h></sdio.h>
	cmd_arg	SDIO command argument
Re	turn	If succeeded return TRUE, if failed return FALSE
Desc	ription

Parameter	handler	Device handle
	cmd	SDIO command with response
	cmd_arg	SDIO command argument
	rsp	Response pointer
Re	turn	Void
Desc	ription	After this function call, the response is stored in rsp
	int E	EMMC_IOCTL(HANDLE handler, UINT32 cmd, VOID *data)
Parameter	handler	Device handle
	cmd	The command that is defined in EMMC.h
	data	Data pointer
Re	turn	If succeeded return ERR_NONE
Desc	ription	EMMC IOCTL command
		int EMMC_CLOSE(HANDLE handler)
Parameter	handler	Device handle
Re	turn	If succeeded return ERR_NONE
Desc	ription	EMMC driver close command

4.5.3 Sample Code

See Ref. [3].

4.6 **PWM**

4.6.1 Introduction

Pulse-Width Modulation (PWM) is a modulation technique used to encode a message into a pulse signal. The blocks are designed to adjust the output pulse duration by means of the CPU bus clock (HCLK).

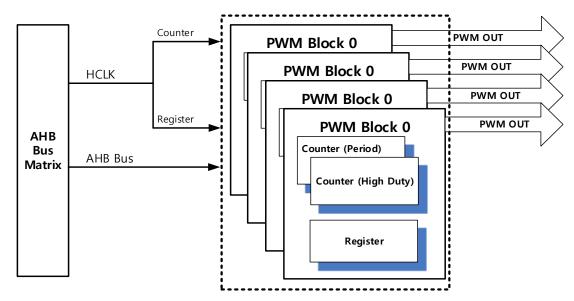

Figure 13: PWM Block Diagram

Table 13: PWM Pin Configuration

Pin Name	Pin Number	I/O	Pin Selection	Function Name
GPIOx		0	Reg. GPIO_SEL.xMUXx	PWM[3:0] output

For more details, see Ref. [1].

4.6.2 Application Programming Interface

Table 14: PWM Interface API Elements

HANDLE DRV_PWM_CREATE(UINT32 dev_id)				
Parameter	dev_id	Device number to create handle		
Return		If succeeded return handle for such device, if failed return NULL		
Desc	cription	Function create handle with parameter "dev_id" designated		
int DRV_PWM_INITf(HANDLE handler)				
Parameter	handler	Device handle to initialize		
Return		If succeeded return TRUE, if failed return FALSE		
Desc	cription	Change GPIO multiplex to PWM mode		
int DRV_PV	int DRV_PWM_START(HANDLE handler, UINT32 period_us, UINT32 hduty_percent, UINT32 dummy)			
Parameter	handler	Device handle to enable pwm device output		
	Period_us	1 cycle period in microsecond		
	Hduty_percent	Output high time in percentage while every 1 cycle		
	dummy	TBD		
Return		If succeeded return TRUE, if failed return FALSE		
Description		Enable PWM block in the DA16200 (DA16600) with specified parameters		
		period = (((period_us * 10) * (clock / 1000000))/10)-1;		
		<pre>// minimum system clock 1mhz hduty = (((period + 1) * hduty_percent) / 100)-1;</pre>		

HANDLE DRV_PWM_CREATE(UINT32 dev_id)				
int DRV_PWM_STOP(HANDLE handler, UINT32 dummy)				
Parameter handler Device handle to stop pwm out		Device handle to stop pwm out		
	cmd	See <pwm.h> in our SDK</pwm.h>		
Return		If succeeded return TRUE, if failed return FALSE		
Description		Disable PWM block in the DA16200 (DA16600)		
	int DRV_PWM_CLOSE(HANDLE handler)			
Parameter	handler	Device handle to close and de-initialize device		
Return		If succeeded return TRUE, if failed return FALSE		
Description		Destroy handle		

4.6.3 Sample Code

See Ref. [3].

4.7 ADC

4.7.1 Introduction

The DA16200 (DA16600) has Analog-to-Digital Converters (ADC): a four-channel single-end ADC of 12-bit resolution. Analog input is measured by means of 4 pins from GPIO0 to GPIO3, and the pin selection is changed through the register setting. See Figure 14 and Table 15.

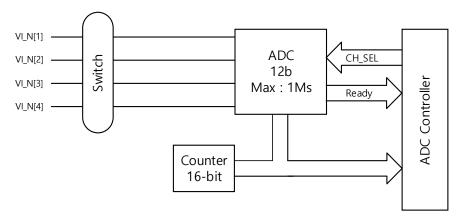

Figure 14: ADC Control Block Diagram

Table 15: AUX ADC Pin Configuration

Din Nama	Pin Number		I/O	Function Name
Pin Name	QFN	fcCSP		Function Name
GPIOA3	36	D4	A	Analog signal
GPIOA2	37	B2	А	Analog signal
GPIOA1	38	C3	A	Analog signal
GPIOA0	39	А3	A	Analog signal

For more details, see Ref. [1].

4.7.2 Application Programming Interface

Table 16: ADC Interface API Elements

		HANDLE DRV_ADC_CREATE(UINT32 dev_id)
Parameter dev_id		Device number to create a handle
Return		If succeeded return handle for such device, if failed return NULL
Descripti	on	Function create handle with parameter dev_id designated
	int DRV_	_ADC_INIT(HANDLE handler, unsigned int use_timestamp)
Parameter	handler	Device handle to initialize
Return	1	If succeeded return TRUE, if failed return FALSE
Descripti	on	ADC Initialization command
	Int DRV	
Parameter	handler	N/A
	cmd	N/A
	data	N/A
Return	1	N/A
Descripti	on	ADC IOCTL command
in	t DRV_ADO	C_START(HANDLE handler, UINT32 divider12, UINT32 dummy)
Parameter	handler	Device handle to start
	divider12	Fs = sys_clk / 15 / (div12 +1)
Return	1	If succeeded return TRUE, if failed return FALSE
Descripti	on	ADC start command
	int	DRV_ADC_STOP(HANDLE handler, UINT32 dummy)
Parameter	handler	Device handle to stop
Return	1	If succeeded return TRUE, if failed return FALSE
Description		ADC stop command
		Int DRV_ADC_CLOSE(HANDLE handler)
Parameter	handler	Device handle to close
Return	1	If succeeded return TRUE, if failed return FALSE
Description		ADC driver close
int DRV	_ADC_REA	AD(HANDLE handler, UINT32 channel, UINT32 *data, UINT32 dummy)
Parameter	handler	Device handle to read
	channel	Channel number to read instant ADC value
	*data	Buffer to read
Return		If succeeded return TRUE, if failed return FALSE
Descripti	on	ADC read command
int DRV_ADC_F	READ_DMA	(HANDLE handler, UINT32 channel, UINT16 *p_data, UINT32 p_dlen, UINT32 dummy)
		

		HANDLE DRV_ADC_CREATE(UINT32 dev_id)
	channel	Channel number to read
	*p_data	Buffer block to read
	p_dlen	Number of samples to read with DMA, not buffer length
Re	eturn	If succeeded return TRUE, if failed return FALSE
Des	cription	ADC read command through DMA
int DRV_A	DC_ENABLE_(CHANNEL(HANDLE handler, UINT32 channel, unsigned int sel_adc, UINT32 dummy)
Parameter	handler	Device handle
	channel	Channel number to set ADC devices
	sel_adc	12: SMI 12B ADC, 0: disable
Re	eturn	If succeeded return TRUE, if failed return FALSE
Des	cription	ADC channel enable command
int DRV_	_ADC_SET_INT	ERRUPT(HANDLE handler, UINT32 channel, UINT32 enable, UINT32 type, UINT32 dummy)
Parameter	handler	Device handle
	channel	Channel number to set interrupt
	enable	1: enable interrupt, 0: disable interrupt
	type	ADC_INTERRUPT_FIFO_HALF (0) ADC_INTERRUPT_FIFO_FULL (1) ADC_INTERRUPT_THD_OVER (2) ADC_INTERRUPT_THD_UNDER (3) ADC_INTERRUPT_THD_DIFF (4) ADC_INTERRUPT_ALL (0xf)
Re	eturn	If succeeded return TRUE, if failed return FALSE
Des	cription	ADC interrupt set command
int DRV_A	DC_SET_THD_	VALUE(HANDLE handler, UINT32 type, UINT32 enable, UINT32 thd, UINT32 dummy);
Parameter	handler	Device handle
	type	ADC_THRESHOLD_TYPE_12B_OVER (0) ADC_THRESHOLD_TYPE_12B_UNDER (2) ADC_THRESHOLD_TYPE_12B_DIFF (4)
	thd	Interrupt threshold. 0 ~ 65535 range. Upper 12 bits of 16-bit data are valid values.
Re	eturn	If succeeded return TRUE, if failed return FALSE
Description		ADC interrupt threshold set command

int DRV_ADC_WAIT_INTERRUPT(HANDLE handler, UNSIGNED *mask_evt);				
Parameter	handler	Device handle		

int DRV_ADC_WAIT_INTERRUPT(HANDLE handler, UNSIGNED *mask_evt);				
*mask_evt	Mask for waiting interrupt			
	bit[19]: Interrupt status for Threshold Difference of CHANNEL 3			
	bit[18]: Interrupt status for Threshold Difference of CHANNEL 2			
	bit[17]: Interrupt status for Threshold Difference of CHANNEL 1			
	bit[16]: Interrupt status for Threshold Difference of CHANNEL 0			
	bit[15]: Interrupt status for Threshold Under level of CHANNEL 3			
	bit[14]: Interrupt status for Threshold Under level of CHANNEL 2			
	bit[13]: Interrupt status for Threshold Under level of CHANNEL 1			
	bit[12] : Interrupt status for Threshold Under level of CHANNEL 0			
	bit[11]: Interrupt status for Threshold Over level of CHANNEL 3			
	bit[10]: Interrupt status for Threshold Over level of CHANNEL 2			
	bit[9] : Interrupt status for Threshold Over level of CHANNEL 1			
	bit[8] : Interrupt status for Threshold Over level of CHANNEL 0			
	bit[7] : Interrupt status for full level of CHANNEL 3			
	bit[6] : Interrupt status for full level of CHANNEL 2			
	bit[5] : Interrupt status for full level of CHANNEL 1			
	bit[4] : Interrupt status for full level of CHANNEL 0			
	bit[3] : Interrupt status for half level of CHANNEL 3			
	bit[2] : Interrupt status for half level of CHANNEL 2			
	bit[1] : Interrupt status for half level of CHANNEL 1			
	bit[0] : Interrupt status for half level of CHANNEL 0			
Return	If receive masked interrupt return			
Description	ADC interrupt wait command			

4.7.3 Interrupt Description

ADC_INTERRUPT_FIFO_HALF: the interrupt that occurs when the FIFO Level is 4 or higher.

ADC_INTERRUPT_FIFO_FULL: the interrupt that occurs when FIFO Level is 8.

ADC_INTERRUPT_THD_OVER: this interrupt is issued when the current input value to the ADC device is greater than the value set in the "ADC_THRESHOLD_TYPE_12B_OVER" type.

ADC_INTERRUPT_THD_UNDER: this interrupt is issued when the current input value to the ADC device is smaller than the value set in the "ADC_THRESHOLD_TYPE_12B_UNDER" type.

ADC_INTERRUPT_THD_DIFF: this interrupt occurs when the difference between the current input value to the ADC device and the previously input value is greater than the value set in "ADC_INTERRUPT_THD_DIFF" type.

4.7.4 Sample Code

See Ref. [3].

4.8 GPIO

4.8.1 Introduction

All digital pads can be used as GPIO. Each GPIO port is mixed with a multi-functional interface. The GPIO features for this device are:

- Input or output lines in a programmable direction
- Word and half word read/write access

- Address-masked byte writes to facilitate quick bit set and clear operations
- Address-based byte reads to facilitate quick bit test operations
- Make a GPIO pin to an interrupt pin possible to be the output signal of PWM [3:0], external Interrupt, SPI_CSB [3:1], RF_SW [1:0] and UART_TXDOE [1:0] on any GPIO pin

It provides special functions for GPIO pin use. PWM [3:0], external interrupt, SPI_CSB [3:1], RF_SW [1:0] and UART_TXDOE [1:0] signals can be output if any of the unused pins among the GPIO pins are selected. It is possible to select the function to be output from the GPIO register setting and select the remaining GPIO pin and not output the specific function to any desired GPIO pin.

Table 17: GPIO Pin Configuration

Pin Name	Pin Number	1/0	Pin Selection	Function Name
GPIOA0	39	I/O	Reg. GPIO_SEL.AMUX9	GPIOA[0]
GPIOA1	38	I/O	Reg. GPIO_SEL.AMUX9	GPIOA[1]
GPIOA2	37	I/O	Reg. GPIO_SEL.BMUX9	GPIOA[2]
GPIOA3	36	I/O	Reg. GPIO_SEL.BMUX9	GPIOA[3]
GPIOA4	34	I/O	Reg. GPIO_SEL.CMUX9	GPIOA[4]
GPIOA5	33	I/O	Reg. GPIO_SEL.CMUX9	GPIOA[5]
GPIOA6	32	I/O	Reg. GPIO_SEL.DMUX9	GPIOA[6]
GPIOA7	31	I/O	Reg. GPIO_SEL.DMUX9	GPIOA[7]
GPIOA8	30	I/O	Reg. GPIO_SEL.EMUX9	GPIOA[8]
GPIOA9	29	I/O	Reg. GPIO_SEL.EMUX9	GPIOA[9]
GPIOA10	28	I/O	Reg. GPIO_SEL.FMUX7	GPIOA[10]
GPIOA11	27	I/O	Reg. GPIO_SEL.FMUX7	GPIOA[11]
GPIOC6	10	I/O	Reg. GPIO_SEL.UMUX2	GPIOC[6]
GPIOC7	9	I/O	Reg. GPIO_SEL.UMUX2	GPIOC[7]
GPIOC8	8	I/O	Reg. GPIO_SEL.UMUX2	GPIOC[8]

If you want to keep GPIO PIN state high or low in sleep state, you need to use one of the following API functions:

- "GPIO_RETAIN_HIGH"
- "GPIO_RETAIN_LOW"

Note that only for GPIOA[11:4], GPIOC[8:6] is possible to set GPIO retention high or low.

On how to use this API, see Ref. [3].

When using GPIO and GPIO Retention API, the status of GPIO PIN is shown in Table 18.

Table 18: The Status of GPIO PIN

	PIN info	Before sleep (RTOS booting)	Sleep period	Sleep period (with SAVE_PULLUP_PINS_INFO)	After sleep(wakeup)
GPIO input	GPIOA[3:0]	high-z	high-z	high-z	high-z
configured	GPIOA[11:8], GPIOC[8:6]	high-z	low(PD)	high-z	high-z
	GPIOA[3:0]	high	high-z	high-z	high-z

	PIN info	Before sleep (RTOS booting)	Sleep period	Sleep period (with SAVE_PULLUP_PINS_INFO)	After sleep(wakeup)
GPIO output high configured	GPIOA[11:8], GPIOC[8:6]	high	low(PD)	high-z	high-z
GPIO output	GPIOA[3:0]	low	high-z	high-z	high-z
low configured	GPIOA[11:8], GPIOC[8:6]		low(PD)	high-z	
GPIO retention high configured	GPIOA[11:8], GPIOC[8:6]	high	high	high	high
GPIO retention low configured	GPIOA[11:8], GPIOC[8:6]	low	low	low	low

If you want to keep GPIO PIN in high-z state in sleep period, you should use the API described in the next Section 4.8.2:

• "SAVE_PULLUP_PINS_INFO"

This function should be used when an external pull-up register is connected to a GPIO PIN. If this function is not used, leakage current may occur.

4.8.2 Application Programming Interface

Table 19: GPIO Interface API Elements

HANDLE G	HANDLE GPIO_CREATE(UINT32 dev_type)		
Parameter	dev_type	Device index	
Retu	ırn	If succeeded, return handle for the device. If failed return NULL	
Descri	ption	The DA16200 (DA16600) can set GPIO_UNIT_A and GPIO_UNIT_C	
int GPIO_IN	IIT (HANDL	E handler)	
Parameter	handler	Device handle	
Return		If succeeded return ERR_NONE	
Description		Configure the GPIO setting	
int GPIO_IOCTL(HANDI		DLE handler, UINT32 cmd, VOID *data)	
Parameter	handler	Device handle	
	cmd	Commands are defined <gpio.h> in our SDK</gpio.h>	
	data Data pointer		
Return		If succeeded return ERR_NONE	

HANDLE G	HANDLE GPIO_CREATE(UINT32 dev_type)				
Description		The necessary configuration of GPIO can be set with this function. Commands are as below:			
		GPIO_GET_DEVREG = 1,			
		GPIO_SET_OUTPUT, // set gpio as an output			
		GPIO_SET_INPUT, // set gpio as an input			
		GPIO_GET_DIRECTION, // get gpio direction			
		GPIO_SET_INTR_MODE, // set gpio interrupt mode [edge/level]			
		GPIO_GET_INTR_MODE, // get gpio interrupt mode			
		GPIO_SET_INTR_ENABLE, // enable gpio interrupt			
		GPIO_SET_INTR_DISABLE, // disable gpio interrupt			
		GPIO_GET_INTR_ENABLE, // get gpio interrupt enable status			
		GPIO_GET_INTR_STATUS, // get gpio interrupt pending status			
		GPIO_SET_INTR_CLEAR, // clear gpio interrupt status			
		GPIO_SET_CALLACK, // set a callback function for gpio interrupt			
int GPIO_R	EAD (HANI	DLE handler, UINT32 addr, UINT16 *pdata, UINT32 dlen)			
Parameter	handler	Device handle			
	addr	gpio index			
p_data D		Data buffer pointer			
	p_dlen	Data buffer length			
Retu	ırn	If succeeded return ERR_NONE			
Description		GPIO value contained in p_data			

int GPIO_WRITE (H	int GPIO_WRITE (HANDLE handler, UINT32 addr, VOID *p_data, UINT32 p_dlen)				
Parameter	handler	Device handle			
	addr	gpio index			
	p_data	Data buffer pointer			
	p_dlen	Data buffer length			
R	eturn	If succeeded return ERR_NONE			
Des	cription	GPIO value contained in p_data			
int GPIO_CLOSE(H	ANDLE handler)				
Parameter	handler	Device handle			
Return		If succeeded return ERR_NONE			
Description		GPIO close command			
INT32 GPIO_GET_A regVal)	ALT_FUNC (HANDLE ha	indler, GPIO_ALT_FUNC_TYPE altFuncType, UINT32 *			
Parameter	handler	Device handle			
	altFuncType	GPIO alternate function type			
	regVal	GPIO alternate function setting value			
Return		If succeeded return 0			

int GPIO_WRITE (H	IANDLE handler, UINT	32 addr, VOID *p_data, UINT32 p_dlen)
Des	cription	Gets GPIO alternate function setting value
	ALT_FUNC(HANDLE handle handle handle)	andler, GPIO_ALT_FUNC_TYPE altFuncType,
Parameter	handler	Device handle
	altFuncType	GPIO alternate function type
	gpioType	GPIO number
R	eturn	If succeeded return 0
Des	cription	Sets GPIO alternate function
INT32 _GPIO_RET	AIN_HIGH(UINT32 gpic	
Parameter	gpio_port	GPIO port number
	gpio_num	GPIO pin number
R	eturn	TRUE if successfully configured, else FALSE.
Des	cription	Note that only for GPIOA[11:4], GPIOC[8:6] is possible to set GPIO retention high. And this API function should not be called from the "config_pin_mux" function
INT32 _GPIO_RET/	AIN_LOW(UINT32 gpio	
Parameter	gpio_port	GPIO port number
	gpio_num	GPIO pin number
R	eturn	TRUE if successfully configured, else FALSE.
Description		Note that only for GPIOA[11:4], GPIOC[8:6] is possible to set GPIO retention high. And this API function should not be called from the "config_pin_mux" function
void SAVE_PULLU	P_PINS_INFO(UINT32	port_num, UINT32 pinnum)
Parameter	port_num	GPIO port number
	pinnum	GPIO pin number
Des	cription	It keeps GPIO PIN in high-z state in sleep period
		This function should be used when an external pull-up register is connected to a GPIO PIN. If this function is not used, leakage current may occur.

4.8.3 Sample Code

See Ref. [3].

4.9 UART

4.9.1 Introduction

The DA16200 (DA16600) has two UARTs (Universal Asynchronous Receiver-Transmitter), which have the following features:

- Programmable use of UART
- Compliance to the AMBA AHB bus specification for easy integration into SoC implementation
- Supports both byte and word access for reduction of bus burden
- Supports both RS-232 and RS-485
- Separate 32x8 bit transmit and 32x12 bit receive FIFO memory buffers to reduce CPU interrupts

- Programmable FIFO disabling for 1-byte depth
- Programmable baud rate generator
- Standard asynchronous communication bits (start, stop and parity). These are added before transmission and removed upon reception
- Independent masking of transmit FIFO, receive FIFO, receive timeout
- Support for Direct Memory Access (DMA)
- False start bit detection
- Programmable flow control
- Fully programmable serial interface characteristics:
 - o Data can be 5, 6, 7 or 8 bits
 - o Even, odd, stick or no-parity bit generation and detection
 - o 1 or 2 stop bit generation
 - o Baud rate generation

Table 20: UART Pin Configuration

4.9.2 Application Programming Interface

Table 21: UART Interface API Elements

HANDLE UART_CREATE(UART_UNIT_IDX dev_idx)				
Parameter	Parameter dev_idx Device index			
Return		If succeeded return handle for such device, if failed return NULL		

	HANDLE UART_CREATE(UART_UNIT_IDX dev_idx)			
Description	on	Function to create a handle with parameter dev_idx designated		
		The DA16200 (DA16600) has two UART ports		
}		<pre>typedef enumuart_unit { UART_UNIT_0 = 0, UART_UNIT_1, UART_UNIT_MAX } UART_UNIT_IDX; Normally, UART0 is used for debug console, and UART1 is used for data transfer</pre>		
int HART INI				
int UART_INIT (HANDLE handler)		Le nanuler)		
Parameter	handler	Device handle		
Retur	n	If succeeded return ERR_NONE		
Descript	ion	The UART configuration should be set before this function is called		
		After this function is called, UART operation starts		
int UART_CHANGE_BAUERATE (HANDLE handler, UINT32 baudrate)		AUERATE (HANDLE handler, UINT32 baudrate)		
Parameter handler		r Device handle		
baudrate		e Baud rate to set		
Return		If succeeded return ERR_NONE		
Descri	ption	This function changes the baud rate of UART during UART operation		

int UART_IOCTL(HANDLE handler, UINT32 cmd, VOID *data)			
Parameter	handler	Device handle	
	cmd	Commands are defined in <uart.h> in the DA16200 (DA16600) SDK</uart.h>	
	data	ata pointer	
Return If succeeded return ERR_NONE		If succeeded return ERR_NONE	

int UART_IOCTL(HA	OCTL(HANDLE handler, UINT32 cmd, VOID *data)		
Description	The user can set the configuration of UART with this function		
	Configurations of UART should be called before the UART_INIT() function.		
	Commands are as below:		
	UART_GET_DEVREG = 1, // get device physical address		
	UART_SET_CLOCK, // set base clock		
	UART_SET_BAUDRATE, // set baud rate		
	UART_GET_BAUDRATE, // get baud rate		
	UART_SET_LINECTRL, // set line control		
	UART_GET_LINECTRL, // get line control		
	UART_SET_CONTROL, // set UART control		
	UART_GET_CONTROL, // get UART control		
	UART_SET_QUESIZE, // set queue size		
	UART_SET_INT, // set interrupt configuration		
	UART_GET_INT, // get interrupt configuration		
	UART_SET_FIFO_INT_LEVEL, // set FIFO level		
	UART_GET_FIFO_INT_LEVEL, // get FIFO level		
	UART_SET_USE_DMA, // set DMA use		
	UART_GET_USE_DMA, // get DMA use		
	UART_CHECK_RXEMPTY, // check RX FIFO empty		
	UART_CHECK_RXFULL, // check RF FIFO full		
	UART_CHECK_TXEMPTY, // check TX FIFO empty		
	UART_CHECK_TXFULL, // check TX FIFO full		
	UART_CHECK_BUSY, // check UART busy		
	UART_SET_RX_SUSPEND, // set the RX function to suspend		
	UART_CLEAR_ERR_INT_CNT, // clear error interrupt counter		
	UART_GET_ERR_INT_CNT, // get error interrupt counter		
	UART_SET_ERR_INT_CALLBACK, // set error interrupt callback function		
	UART_CLEAR_FRAME_INT_CNT, //clear frame error interrupt counter		
	UART_GET_FRAME_INT_CNT, // get frame error interrupt counter		
	UART_SET_FRAME_INT_CALLBACK, // set frame error interrupt callback		
	UART_CLEAR_PARITY_INT_CNT, // clear parity error interrupt counter		
	UART_GET_PARITY_INT_CNT, // get frame error interrupt counter		
	UART_SET_PARITY_INT_CALLBACK, // set frame error interrupt callback		
	UART_CLEAR_BREAK_INT_CNT, // clear break error interrupt counter		
	UART_GET_BREAK_INT_CNT, // get break error interrupt counter		
	UART_SET_BREAK_INT_CALLBACK, // set break error interrupt callback		
	UART_CLEAR_OVERRUN_INT_CNT, // clear overrun error interrupt counter		
	UART_GET_OVERRUN_INT_CNT, // get overrun error interrupt counter		
	UART_SET_OVERRUN_INT_CALLBACK, // set overrun interrupt callback		
	The user can find more information in 'uart.h' file		

int UART_F	int UART_READ (HANDLE handler, VOID *p_data, UINT32 p_dlen)		
Parameter	handler	Device handle	
	p_data	Data pointer	
	p_dlen Length to read		
Return If succeeded return ERR_NONE		If succeeded return ERR_NONE	

int UART RE	EAD (HAN	IDLE handler, VOID *p_data, UINT32 p_dlen)	
Description L		User can use the UART_SET_RX_SUSPEND ioctl command to set the UART READ operation to suspend or not	
int UART_WI	RITE (HA	NDLE handler, VOID *p_data, UINT32 p_dlen)	
Parameter	handler	Device handle	
	p_data	Data pointer	
	p_dlen	Length to write	
Retur	'n	If succeeded return ERR_NONE	
Descrip	tion	UART write command	
int UART_DN	/IA_REA	(HANDLE handler, VOID *p_data, UINT32 p_dlen)	
Parameter	handler	Device handle	
	p_data	Data pointer	
	p_dlen	Length to read	
Retur	'n	If succeeded return ERR_NONE	
Descrip	tion	The operation of this function is the same with UART_READ, except DMA is used	
int UART_DN	/IA_WRIT	E (HANDLE handler, VOID *p_data, UINT32 p_dlen)	
Parameter	handler	Device handle	
	p_data	Data pointer	
	p_dlen	Length to write	
Retur	'n	If succeeded return ERR_NONE	
Descrip	tion	The operation of this function is same with UART_WRITE, except DMA is used	
int UART_FL	.USH(HAI	NDLE handler)	
Parameter	handler	Device handle	
Retur	'n	If succeeded return ERR_NONE	
Description		Flush the FIFO buffer of UART	
int UART_CLOSE(HAN		NDLE handler)	
Parameter	handler	Device handle	
Retur	rn	If succeeded return ERR_NONE	
Description		UART driver close command	

4.9.3 Sample Code

See Ref. [3].

4.10 SPI Master

4.10.1 Introduction

The SPI master communicates in full duplex mode that uses a master-slave architecture with a single master. The master device originates the frame to be read or written. Multiple slave-devices are supported with the selection of individual chip select (CS) lines.

Table 22 shows the pin definition of the SPI master interface. To use as an SPI master, the CSB signal can be used with any of the GPIO pins. CSB [3:2] can be selected from the GPIO special function. This is done through register settings in the GPIO.

Table 22: SPI Master Pin Configuration

Pin Name	Pin Number		I/O	Function Name
Pin Name	QFN	fcCSP		runction Name
GPIOx			0	E_SPI_CSB[3:1]
GPIOA6	32	E3	0	E_SPI_CSB[0]
GPIOA7	31	E1	0	E_SPI_CLK
GPIOA8	30	G3	I/O	E_SPI_MOSI or E_SPI_D[0]
GPIOA9	29	H2	I/O	E_SPI_MISO or E_SPI_D[1]
GPIOA10	28	F2	I/O	E_SPI_D[2]
GPIOA11	27	G1	I/O	E_SPI_D[3]

4.10.2 Application Programming Interface

Table 23: SPI Interface API Elements

HANDLE SI	HANDLE SPI_CREATE(UINT32 dev_id)			
Parameter	Parameter dev_id Instance Number of SPI (UINT32))			
Retu	rn	Handler of SPI Driver (HANDLE)		
Descrip	otion	Returns the SPI Handler that is defined in file "spi.h"		
	create the GPIO handler for chip selection			
int SPI_INIT	int SPI_INIT (HANDLE handler)			
Parameter Handler SPI Driver (HANDLE)				
Return		TRUE / FALSE (int)		
Descrip	otion	Initializes the SPI Handler to set up GPIO and activate the ISR		
 create the MUTEX for support to control multi-slaves 				

int SPI_IOC	int SPI_IOCTL(HANDLE handler, UINT32 cmd, VOID *data)		
Parameter	Handler	SPI Driver (HANDLE)	
	Cmd	IOCTL command	
	data	IOCTL parameters	
Return		TRUE / FALSE (int)	

int SPI_IOCT	int SPI_IOCTL(HANDLE handler, UINT32 cmd, VOID *data)			
Description		SPI_SET_SPEED		
		set the target SPI clock		
		SPI_GET_SPEED		
		get the current value of SPI clock		
		SPI_SET_FORMAT		
		set the SPI interface mode		
		○ SPI_TYPE_MOTOROLA_O0H0		
		○ SPI_TYPE_MOTOROLA_O1H1		
		SPI_SET_DMAMODE		
		set the DMA transfer mode to the DMA mode		
		SPI_GET_MAX_LENGTH		
		• the maximum burst size		
		SPI_SET_MAX_LENGTH		
		set the maximum burst size (up to 63 kB) ORL SET, CALLACK		
		SPI_SET_CALLACK		
		set the user defined callbacks. SELINTIPY ROBINT: the receive everyon integration.		
		SPI_INTIDX_RORINT: the receive overrun interrupt		
		 SPI_INTIDX_RTMINT: the receive timeout interrupt SPI_INTIDX_RXINT: when there are four or more data in the RX FIFO 		
		SPI_INTIDX_TXINT: when there are four or less data in the TX FIFO SPI_INTIDX_TXINT: when there are four or less data in the TX FIFO		
		SPI_SET_CONCAT		
		set the SPI burst mode to the concatenation mode		
		SPI_SET_BUSCONTROL		
		set the SPU bus access mode		
		SPI_GET_BUSCONTROL		
		get the current value of SPI bus access mode		
		SPI_GET_DELAYSEL		
		get the parameters of current delay model		
		SPI_SET_LOCK		
		lock/unlock the mutex of SPI driver		
int SPI_REA	D(HANDL	E handler, void *pdata, UINT32 dlen)		
Parameter	Handler	SPI Driver (HANDLE)		
Retur	'n	zero - false, non-zero - data length (int)		
Descrip	tion	SPI read operation		
		pdata: RX data buffer		
		dlen: byte length		

int SPI_WRITE	(HANDLE h	andler, void *pdata, UINT32 dlen)	
Parameter	Handler	SPI Driver (HANDLE)	
Retur	'n	zero - false, non-zero - data length (int)	
Descrip	tion	SPI write operation	
		pdata: TX data buffer	
		dlen: byte length	
int SPI_WRIT	E_READ(HA	NDLE handler, void *snddata, UINT32 sndlen, void *rcvdata, UINT32 rcvlen)	
Parameter	Handler	SPI Driver (HANDLE)	
Retur	'n	zero - false, non-zero - data length (int)	
Descrip	tion	SPI write and read operation (write before read)	
		This function will run in concatenation mode internally	
		snddata: TX data buffer	
		sndlen: byte length	
		rcvdata: TX data buffer	
		rcvlen: byte length	
Int SPI_TRAN	NSMIT(HANI	DLE handler, VOID *snddata, UINT32 sndlen, VOID *rcvdata, UINT32 rcvlen)	
Parameter	Handler	SPI Driver (HANDLE)	
Retur	'n	zero - false, non-zero - data length (int)	
Descrip	tion	Basic operation running once in SPI burst mode (send before receive)	
		This function does not support to change a bus mode automatically	
		snddata: TX data buffer	
		sndlen: byte length	
		rcvdata: TX data buffer	
		rcvlen: byte length	
Int SPI_CLOSE	E(HANDLE h	nandler)	
Parameter	Handler	SPI Driver (HANDLE)	
Retur	'n	TRUE / FALSE (int)	
Description		Release the SPI handler	

4.10.3 Sample Code

See Ref. [3].

4.11 OTP

4.11.1 Introduction

The DA16200 (DA16600) includes a one-time electrically field programmable non-volatile CMOS memory.

This memory is to protect and manage major information essential for mass production and management of products, such as booting information, MAC address, serial number, and others.

The OTP is also used for storing secret information which is used for the advanced security functions like secure booting, secure debugging, and secure asset storage. But this secret information cannot be accessed in a normal way of CPU read or write access so that it is protected from the external access.

Table 24: OTP Map

Offset	Field	Size (Bytes)
0x000	Renesas Reserved	1024
0x100	MAC Address #0 Low	4
0x101	MAC Address #0 High	4
0x102	MAC Address #1 Low	4
0x103	MAC Address #1 High	4
0x104	MAC Address #2 Low	4
0x105	MAC Address #2 High	4
0x106	MAC Address #3 Low	4
0x107	MAC Address #3 High	4
0x10A	XTAL Offset #0	4
0x10B	XTAL Offset #1	4
0x10C to 0x1FE	User Area	972

4.11.2 Application Programming Interface

Table 25: OTP API Elements

void otp_m	em_create	e(void)
Parameter	void	void
Retu	rn	void
Descrip	otion	Initialize OTP HW
		Before calling this function, it needs otp_clock_enable
		{
		DA16200_SYSCLOCK ->PLL_CLK_EN_4_PHY = 1;
		DA16200_SYSCLOCK ->CLK_EN_PHYBUS = 1;
		extern void DA16X_SecureBoot_OTPLock(unsigned int mode);
		DA16X_SecureBoot_OTPLock(1); // unlock
		#define CLK_GATING_OTP 0x50006048
		MEM_BYTE_WRITE(CLK_GATING_OTP, 0x00);
		otp_mem_create();
		}

void otp_m	em_close((void)	
Parameter	void	void void	
Return		void	
Descrip	otion	Close the OTP HW	
int otp_mer	n_read(UI	NT32 offset, UINT32 *data)	
D	offset	OTP memory offset (0x00 ~ 0x1FE)	
Parameter	data	[out] data pointer of buffer	
Retu	rn	OTP_OK if successes	
Descrip	otion	Each offset store 32-bit data Offset 0x00 to 0x2c used for secure purpose. So, it may not accessible See Table 24	
int otp_men	n_write (U	INT32 offset, UINT32 data)	
Doromotor	offset	OTP memory offset (0x00 ~ 0x1FE)	
Parameter	data	Data to write	
Retu	rn	OTP_OK if successes	
Descrip	otion	Offset 0x00 to 0x2c used for secure purpose. Do not write any data within. See Table 24	
int otp_mer	n_lock_re	ad (UINT32 offset, UINT32 *data)	
Parameter	offset	Lock status offset. Always (0xFFF)	
Talameter	data	Data pointer of lock status	
Retu	rn	OTP_OK if successes	
Description		The OTP memory can be locked. Each lock bit can lock range ~ 0x40 For example: lock status value 0x00000002, it means that offset 0x40~0x7F OTP memory locked. lock bit 0 lock offset 0 ~ 0x3F lock bit 1 lock offset 0x40 ~ 0x7F lock bit 2 lock offset 0x80 ~ 0xBF lock bit 3 lock offset 0xC0 ~ 0xFF lock bit 4 lock offset 0x100 ~ 0x13F lock bit 5 lock offset 0x140 ~ 0x17F lock bit 6 lock offset 0x180 ~ 0x1BF lock bit 7 lock offset 0x1C0 ~ 0x1FE	
int otp_mem_lock_write (UIN		rite (UINT32 offset, UINT32 *data)	
-	offset	Lock status offset. Always (0xFFF)	
Parameter	data	Lock status value.	
Retu	rn	OTP_OK if successes	
Description		Refer otp_mem_lock_read()	

5 NVRAM

The DA16200 (DA16600) has an NVRAM area on the flash memory to store system data and user data. NVRAM has various system configuration parameters to control the Wi-Fi function.

5.1 Application Programming Interface

There are NVRAM items of datatype integer and string. You need to use the following functions according to the item datatype.

Table 26: NVRAM API Elements

int write_nvram_int(const char *name, int val)			
Parameter	name	NVRAM item name to write	
	value	Integer value to write	
Return		If succeeded return 0, if failed return an error code	
Description	on	Write a specific NVRAM item with an integer value	
int write_nvram_s	string(const	char *name, const char *val)	
Parameter	name	NVRAM item name to write	
	value	Pointer to the string buffer to write	
Return		If succeeded return 0, if failed return an error code	
Description	on	Write a specific NVRAM item with a string value	
int read_nvram_ii	nt(const cha	ar *name, int *_val)	
Parameter	name	NVRAM item name to read	
	value	Pointer to the integer value to read the value	
Return		If succeeded return 0, if failed return an error code	
Description	on	Read an integer value of a specific NVRAM item	
char *read_nvram	_string(cor	nst char *name)	
Parameter	name	NVRAM item name to get	
	value	Pointer to the string buffer to read the value	
Return		If succeeded return 0, if failed return an error code	
Description		Read an integer value of a specific NVRAM item	

6 HW Accelerators

6.1 Set SRAM to Zero

6.1.1 Application Programming Interface

Table 27: HW Acc API Elements

void da16x_memset32(UINT32 *data, UINT32 seed, UINT32 length)						
Parameter	data	Buffer pointer to set				
	seed	value to fill				
	length	length				
Return		None				
Description		Fill up memory with a certain value via HW acceleration				

6.1.2 Sample Code

```
#include <hal.h>

/* fill up a 1024 bytes buffer memory with 0 */
UINT32 buffer[1024];
da16x memset32(buffer, 0, 1024);
```

6.2 CRC Calculation

6.2.1 Application Programming Interface

Table 28: CRC API Elements

UINT32 da16x_hwcrc32(UINT32 dwidth, UINT8 *data, UINT32 length, UINT32 seed)							
Parameter	dwidth	Data width to calculate CRC					
	Data	Data pointer					
length		Length					
	seed	CRC32 seed value (default value is 0xFFFFFFF)					
Return		Calculated CRC32 value					
Description		Calculate CRC via HW accelerator					

6.2.2 Sample Code

6.3 Pseudo Random Number Generator (PRNG)

6.3.1 Application Programming Interface

Table 29: PRNG API Elements

UINT32 da16x_random(void)								
Parameter	Parameter void							
Return		32 bits random value						
Description		Generates 32 bits random value via HW accelerator						

6.3.2 Sample Code

```
#include <hal.h>
UINT32 random = dal6x_random();
```

6.4 Memory Copy Using DMA

6.4.1 Application Programming Interface

Table 30: HW DMA Elements

iı	int memcpy_dma (void *dest, void *src, unsigned int len, unsigned int wait_time)								
Parameter	dest	A pointer to where you want the function to copy the data (4 B Aligned)							
	src	A pointer to the buffer that you want to copy data from (4 B Aligned)							
	len	The number of bytes to copy							
	wait_time	0: After starting DMA operation, return from function							
		N: Wait until memory copy is finished. If DMA operation time is greater than N milliseconds, the function returns after N milliseconds. N must have a value of at least 10 ms							
Return		Always '0'							
Description		Copy bytes from one buffer to another, using DMA							

6.4.2 Sample Code

```
#include <sys_dma.h>
char dest[100], src[100]
memcpy_dma(dest, src, 100, 0);
```

7 Wi-Fi Interface Configuration

The DA16200 (DA16600) SDK defines various parameters for Wi-Fi interface configuration and they are saved as profiles in the NVRAM. After system reset, the DA16200 (DA16600) reads an existing profile and sets the Wi-Fi interface based on that profile.

7.1 Application Programming Interface

The DA16200 (DA16600) SDK provides several functions with the following features to get or set system profiles:

- · Four simple functions to get or set each parameter
- Error code to verify the result

Each parameter is related to an NVRAM item so there are integer datatype parameters and string datatype parameters. You need to use these functions according to parameter type.

Table 31: Wi-Fi Configuration API

int da16x_s	set_config_	int(int name, int value)							
Parameter	name	Parameter index to set							
	value	Integer value to set							
Ret	urn	If succeeded return 0 (CC_SUCCESS), if failed return an error code							
Descr	iption	Set a specific parameter with an integer value							
		For example: ret = da16x_set_config_int (Da16x_CONF_INT_CHANNEL, 11)							
		Set the operating channel of the AP interface to 11							
int da16x_s	et_config_	str (int name, char *value)							
Parameter	name	Parameter index to set							
	value	Pointer to the string value to set							
Ret	urn	If succeeded return 0 (CC_SUCCESS), if failed return an error code							
Descr	iption	Set a specific parameter with a string value							
		For example: ret = da16x_set_config_int(Da16x_CONF_STR_IP_0, "10.0.0.1")							
		Set the IP address of the STA interface to 10.0.0.1							
int da16x_g	jet_config_	int (int name, int *value)							
Parameter	name	Parameter index to get							
	value	Pointer to the integer variable to get the parameter value							
Ret	urn	If succeeded return 0 (CC_SUCCESS), if failed return an error code							
Descr	iption	Get an integer value of a specific parameter							
		For example: ret = da16x_get_config_int(Da16x_CONF_INT_CHANNEL, &channel)							
		Get the operating channel of the AP interface							
int da16x_g	get_config_	str (int name, char *value)							
Parameter	name	Parameter index to get							
	value	Pointer to the string buffer to get the parameter value							
Ret	urn	If succeeded return 0 (CC_SUCCESS), if failed return an error code							
Descr	iption	Get a string value of a specific parameter							
		For example: ret = da16x_get_config_str(Da16x_CONF_STR_IP_0, ip_addr)							
		Get the IP address of the STA interface							

int da16x_s	int da16x_set_config_int(int name, int value)									
int da16x_s	et_nvcache	e_str(int name, char *value)								
Parameter	name	Parameter name to set								
	value	Points to the value (str) to set								
Reti	urn	If succeeded, return 0 (CC_SUCCESS), if failed return an error code								
Descri	iption	Set name/value pair to NVRAM cache area (not in sflash). To make permanent, invoke da16x_nvcache2flash()								
		For example: ret = da16x_set_nvcache_str(Da16x_CONF_STR_IP_0, ip_addr)								
		Set IP address of the STA interface								
int da16x_s	et_nvcache	_int(int name, int value)								
Parameter	name	Parameter name to set								
	value	Points to the value (int) to set								
Reti	urn	If succeeded, return 0 (CC_SUCCESS), if failed return an error code								
Descri	iption	Set name/value pair to NVRAM cache area (not in sflash). To make permanent, invoke da16x_nvcache2flash ()								
		For example: ret = da16x_set_nvcache_int(Da16x_CONF_INT_CHANNEL, 11)								
		Set the operating channel of the AP interface to 11								
void da16x_nvcache2fl		ash(void)								
Parameter	void	void								
Reti	urn	void								
Description		Commit parameters (set by da16x_set_nvcache_int/str) in NVRAM cache to flash								

7.1.1 Integer Type Parameters

Table 32: NVRAM Integer Type

Name	Description
DA16X_CONF_INT_MODE	Wi-Fi operation mode
	• 0: STA
	• 1: Soft-AP
DA16X_CONF_INT_AUTH_MODE_0	Wi-Fi authentication mode for STA interface
	CC_VAL_AUTH_OPEN
	CC_VAL_AUTH_WEP
	CC_VAL_AUTH_WPA
	CC_VAL_AUTH_WPA2
	CC_VAL_AUTH_WPA_AUTO (WPA & WPA2)
DA16X_CONF_INT_AUTH_MODE_1	Wi-Fi authentication mode for Soft-AP interface
	CC_VAL_AUTH_OPEN
	CC_VAL_AUTH_WPA
	CC_VAL_AUTH_WPA2
	CC_VAL_AUTH_WPA_AUTO (WPA & WPA2)
	(WEP is unsupported on the DA16200 (DA16600) AP mode)
DA16X_CONF_INT_WEP_KEY_INDEX	Wi-Fi WEP key index number (0~3)

Name	Description
DA16X_CONF_INT_ENCRYPTION_0	Wi-Fi data encryption mode for STA interface
	CC_VAL_ENC_TKIP
	CC_VAL_ENC_CCMP
	CC_VAL_ENC_AUTO (TKIP & CCMP)
DA16X_CONF_INT_ENCRYPTION_1	Wi-Fi data encryption mode for Soft-AP interface
	CC_VAL_ENC_TKIP
	CC_VAL_ENC_CCMP
	CC_VAL_ENC_AUTO (TKIP & CCMP)
DA16X_CONF_INT_WIFI_MODE_0	Wi-Fi mode based on IEEE 802.11 standard for STA interface
	CC_VAL_WFMODE_BGN
	CC_VAL_WFMODE_GN
	CC_VAL_WFMODE_BG CO_VAL_WFMODE_N
	CC_VAL_WFMODE_N CC_VAL_WFMODE_C
	CC_VAL_WFMODE_G CC_VAL_WFMODE_B
DA16X_CONF_INT_WIFI_MODE_1	Wi-Fi mode based on IEEE 802.11 standard for Soft-AP interface
	CC_VAL_WFMODE_BGN
	CC_VAL_WFMODE_GN
	CC_VAL_WFMODE_BG
	CC_VAL_WFMODE_N
	CC_VAL_WFMODE_G
	CC_VAL_WFMODE_B
DA16X_CONF_INT_CHANNEL	Soft-AP operation channel setting by channel number
	• 1~11: for US
	0: Auto
DA16X_CONF_INT_FREQUENCY	Soft-AP operation channel setting by frequency value (MHz)
DA16X_CONF_INT_ROAM	Operating roaming function for STA interface
	• 0: Stop
	• 1: Run
DA16X_CONF_INT_ROAM_THRESHOLD	Roaming threshold for STA interface (-95 ~ 0 dBm)
DA16X_CONF_INT_BEACON_INTERVAL	IEEE 802.11 beacon interval (msec.)
DA16X_CONF_INT_INACTIVITY	Inactive STA disconnecting time (sec.)
DA16X_CONF_INT_RTS_THRESHOLD	IEEE 802.11 RTS threshold (byte)
DA16X_CONF_INT_WMM	WMM On/Off setting
	• 0: Off
	• 1: On
DA16X_CONF_INT_WMM_PS	WMM-PS On/Off setting
	• 0: Off
	• 1: On
DA16X_CONF_INT_DHCP_CLIENT	DHCP client On/Off for STA interface
	• 0: Off
	• 1: On

Name	Description
DA16X_CONF_INT_DHCP_SERVER	DHCP server On/Off for Soft-AP interface
	• 0: Off
	• 1: On
DA16X_CONF_INT_DHCP_LEASE_TIME	DHCP server lease time (sec.)

7.1.2 String Type Parameters

Table 33: NVRAM String Type

Name	Description
DA16X_CONF_STR_SSID_0	AP SSID to connect (~ 32 letters)
DA16X_CONF_STR_SSID_1	Soft-AP SSID to operate (~ 32 letters)
DA16X_CONF_STR_WEP_KEY0 DA16X_CONF_STR_WEP_KEY1 DA16X_CONF_STR_WEP_KEY2 DA16X_CONF_STR_WEP_KEY3	WEP keys of the AP to connect (5 or 13 letters with ASCII / 10 or 26 letters with hexadecimal)
DA16X_CONF_STR_PSK_0	PSK of the AP to connect (~ 63 letters)
DA16X_CONF_STR_PSK_1	Soft-AP PSK to operate (~ 63 letters)
DA16X_CONF_STR_COUNTRY	Country code (2 or 3 letters, for example KR, US, JP, CH, etc.) defined by ISO 3166-1 alpha-2 standard
DA16X_CONF_STR_DEVICE_NAME	DA16200 (DA16600) device name (for WPS or Wi-Fi Direct)
DA16X_CONF_STR_IP_0	STA interface IP address
DA16X_CONF_STR_NETMASK_0	STA interface netmask
DA16X_CONF_STR_GATEWAY_0	STA interface gateway address
DA16X_CONF_STR_IP_1	Soft-AP interface IP address
DA16X_CONF_STR_NETMASK_1	Soft-AP interface netmask
DA16X_CONF_STR_GATEWAY_1	Soft-AP interface gateway address
DA16X_CONF_STR_DNS_0	STA interface DNS address
DA16X_CONF_STR_DHCP_START_IP DA16X_CONF_STR_DHCP_END_IP	DHCP server IP range assigned
DA16X_CONF_STR_DHCP_DNS	DHCP server DNS IP address assigned

7.1.3 Sample Code

If you need to set many name/value NVRAM parameters at the same time, then use ${\tt dal6x_set_nvcache_int/str()}$ and ${\tt dal6x_nvcache2flash()}$. Use of ${\tt dal6x_set_config_str/int()}$ is good for setting one or two values, but if there is a need to set many NVRAM parameters (that is Soft-AP / STA setup), then always use cache function ${\tt dal6x_set_nvcache_int/str}$ followed by ${\tt dal6x_nvcache2flash()}$, which will give much better performance to your application.

The following example explains how to set STA mode.

Table 34: NVRAM Sample Code on STA Mode

/+ TT' TI' OE'	
/* Wi-Fi Configuration */	
1	

```
clear tmp nvram env(); // Clear Cache
// start setting name/value NVRAM parameters to NVRAM Cache (no delay)
dal6x set nvcache int(DA16X CONF INT MODE, 0);
dal6x set nvcache str(DA16X CONF STR SSID 0, ssid);
dal6x set nvcache int (DAl6X CONF INT AUTH MODE 0, auth type);
if (auth type == CC VAL AUTH WEP) {
              dal6x set nvcache str(DA16X CONF STR WEP KEY0, wep key[0]);
              dal6x_set_nvcache_str(DAl6X CONF STR WEP KEY1, wep key[1]);
              dal6x set nvcache str(DAl6X CONF STR WEP KEY2, wep key[2]);
              dal6x set nvcache str(DAl6X CONF STR WEP KEY3, wep key[3]);
              dal6x set nvcache str(DA16X CONF INT WEP KEY INDEX, wep key index);
} else if (auth type > CC VAL AUTH WEP) {
       dal6x set nvcache str(DA16X CONF STR PSK 0, psk);
       dal6x_set_nvcache_int(DAl6X_CONF_INT_ENCRYPTION 0, encryption);
dal6x set nvcache int(DA16X CONF INT WIFI MODE 0, wifi mode);
/* IP & DHCP Client Setting */
dal6x set nvcache int(DA16X CONF INT DHCP CLIENT, dhcp client);
if (!dhcp client) {
       dal6x set nvcache str(DA16X CONF STR IP 0, ip);
       dal6x set nvcache str(DA16X CONF STR NETMASK 0, subnet);
       dal6x set nvcache str(DAl6X CONF STR GATEWAY 0, gateway);
       da16x set nvcache str(DA16X CONF STR DNS 0, dns);
dal6x nvcache2flash(); // commit name/value params in Cache to flash memory
reboot func (SYS REBOOT);
```

The following example explains how to set Soft-AP mode.

Table 35: NVRAM Sample Code on Soft-AP Mode

```
/* SoftAP Configuration */
clear tmp nvram env(); // Clear Cache
// start setting name/value NVRAM parameters to NVRAM Cache (no delay)
dal6x set nvcache int(DA16X CONF INT MODE, 1);
dal6x set nvcache str(DAl6X CONF STR SSID 1, ssid);
dal6x set nvcache int(DAl6X CONF INT AUTH MODE 1, auth type);
if (auth type > CC VAL AUTH WEP) {
       dal6x set nvcache str (DA16X CONF STR PSK 1, psk);
       da16x set nvcache int(DA16X CONF INT ENCRYPTION 1, encryption);
dal6x set nvcache int(DA16X CONF INT CHANNEL, channel);
dal6x set nvcache int(DA16X CONF STR COUNTRY, country code);
dal6x set nvcache int(DAl6X CONF INT WIFI MODE 1, wifi mode);
dal6x set nvcache int (DA16X CONF INT WMM, wmm);
dal6x set nvcache int(DAl6X CONF INT WMM PS, wmm ps);
/* IP Setting */
dal6x set nvcache str(DAl6X CONF STR IP 1, ip);
dal6x set nvcache str(DAl6X CONF STR NETMASK 1, subnet);
da16x set nvcache str(DA16X CONF STR GATEWAY 1, gateway);
```

```
/* DHCP Server Setting */
if (dhcp_server) {
    dal6x_set_nvcache_str(DAl6X_CONF_STR_DHCP_START_IP, start_ip);
    dal6x_set_nvcache_str(DAl6X_CONF_STR_DHCP_END_IP, end_ip);
    dal6x_set_nvcache_str(DAl6X_CONF_STR_DHCP_DNS, dhcp_dns);
    dal6x_set_nvcache_str(DAl6X_CONF_INT_DHCP_LEASE_TIME, dhcp_lease_time);
}
dal6x_set_nvcache_int(DAl6X_CONF_INT_DHCP_SERVER, dhcp_server);

dal6x_nvcache2flash(); // commit name/value params in Cache to flash memory
reboot_func(SYS_REBOOT);
```

7.2 Soft-AP Configuration by Factory Reset

Many IoT devices start as a Soft-AP device to operate AP provisioning. The DA16200 (DA16600) has a Factory Reset function to change to Soft-AP mode after the Factory Reset button is clicked. This button is described in the section **Board Description** in Ref. [2] and is connected to GPIO 7 on the DA16200 (DA16600) EVB.

You can configure the Soft-AP interface with your own values. The DA16200 (DA16600) SDK provides a simple way to do this. This section describes how to configure the default values in the DA16200 (DA16600) SDK.

7.2.1 Configuration Data Structure Integer Type Parameters

The DA16200 (DA16600) SDK has the structure shown in Table 36 to configure Soft-AP interface.

Table 36: Soft-AP Interface Code

```
[ ~/FreeRTOS SDK/core/system/include/common/da16x network common.h ]
/* For Customer's Soft-AP configuration */
#define MAX SSID LEN
                               32
           MAX PASSKEY LEN

           dhcpd lease time;
   int
           dhcpd start ip[MAX IP ADDR LEN];
   char
           dhcpd end ip[MAX IP ADDR LEN];
   char
   char
           dhcpd dns ip addr[MAX IP ADDR LEN];
softap config t;
```

- int customer_cfg_flag: Flag for user configuration
 - MODE_DISABLE (0) : Do not use user configuration
 - MODE_ENABLE (1) : Use user configuration
- char ssid_name[MAX_SSID_LEN+1]: SSID of Soft-AP. Max length is 32 bytes
- char psk[MAX_PASSKEY_LEN]: Pairwise key. Max length is 64 bytes
- char auth_type: Authentication type
 - OPEN_MODE (0)
 - AP_SECURITY_MODE (1)
- char country_code [4]: Country code

See the section on Country Code in Ref. [3] or Appendix B.1

int customer_ip_address: IP address type

IPADDR_DEFAULT (0) : IP class is 10.0.0.1
 IPADDR_CUSTOMER (1) : User defined IP address

The following parameters should be defined:

char ip_addr[MAX_IP_ADDR_LEN]

char subnet_mask[MAX_IP_ADDR_LEN]
char default_gw[MAX_IP_ADDR_LEN]
char default_gw[MAX_IP_ADDR_LEN]

char dns_ip_addr[MAX_IP_ADDR_LEN]

int customer_dhcpd_flag: DHCP server IP address range

DHCPD_DEFAULT (0) : 10.0.0.2 ~ 10.0.0.11 (10 clients)

DHCPD_CUSTOMER (1) : User defined range

Need to define the following parameters:

int dhcpd_lease_time

char dhcpd_start_ip[MAX_IP_ADDR_LEN]
char dhcpd_end_ip[MAX_IP_ADDR_LEN]

char dhcpd_dns_ip_addr[MAX_IP_ADDR_LEN]

7.2.2 How to Configure the Soft-AP Interface

The DA16200 (DA16600) SDK has the function shown in Table 37 to configure the Soft-AP interface. You can write your own values. This function is invoked when a factory reset is done.

Table 37: Soft-AP Configuration Code

```
[ ~/FreeRTOS SDK/customer/user main/src/system start.c ]
void set customer softap config(void)
#ifdef SUPPORT FACTORY RST APMODE
      /* Set to user costomer's configuration */
      ap config param->customer cfg flag = MODE DISABLE;
       // MODE ENABLE, MODE DISABLE
       * Wi-Fi configuration
       */
       /* SSID prefix */
      sprintf(ap config param->ssid name, "%s", "DA16200");
      /* Default open mode: AP OPEN MODE, AP SECURITY MODE */
      ap config param->auth type = AP OPEN MODE;
      if (ap config param->auth type = AP SECURITY MODE);
       sprintf(ap config param->psk, "%s", "12345678");
      /* Country Code: Default country US */
      sprintf(ap config param->country code, "%s", DFLT AP COUNTRY CODE);
       * Network IP address configuration
       */
      ap config param->customer ip address = IPADDR DEFAULT;
      if (ap config param->customer ip address == IPADDR CUSTOMER) {
       sprintf(ap_config_param->ip_addr, "%s", "192.168.1.1");
sprintf(ap_config_param->subnet_mask, sprintf(ap_config_param->default_gw, sprintf(ap_config_param->dns_ip_addr, "%s", "192.168.1.1");
sprintf(ap_config_param->dns_ip_addr, "%s", "8.8.8.8");
       * DHCP Server configuration
      ap config param->customer dhcpd flag = DHCPD DEFAULT;
      if (ap config param->customer dhcpd flag == DHCPD CUSTOMER) {
       ap config param->dhcpd lease time = 3600;
       sprintf(ap config param->dhcpd start ip, "%s", "192.168.1.101");
       sprintf(ap config param->dhcpd end ip, "%s", "192.168.1.108");
       sprintf(ap config param->dhcpd dns ip addr, "%s", "8.8.8.8");
#endif /* SUPPORT FACTORY RST APMODE */
```

7.3 Soft-AP Provisioning Protocol

The DA16200 (DA16600) supports the Soft-AP mode for a Wi-Fi interface setup. The provisioning thread automatically runs when the DA16200 (DA16600) starts in Soft-AP mode.

See DA16200 (DA16600) Provisioning the Mobile App in Ref. [5].

8 TX Power Table Edit

The DA16200 (DA16600) SDK allows users to tune and edit Tx Power (per channel) for FCC or country-dependent product customization/optimization.

Ch.2		1	1b		11g							11n

Figure 15: TX Power Table

8.1 Tune TX Power

Before setting TX power to your Main image, you may need to tune and test TX power. The following procedure shows how to change the TX power index for each channel with console commands, TX power indices, and corresponding power values.

1. Run command setup to configure the station interface. See Figure 16.

```
[/DA16200] # setup

Stop all services for the setting.
Are you sure ? [Yes/No] : y
```

Figure 16: Tune TX Power: Setup

2. At prompt COUNTRY CODE? [Quit] (Default KR): enter ALL as the country code for Tx Power tuning purpose. See Figure 17.

COUNTRY CODE ? [Quit] (Default KR) :
```

Figure 17: Tune TX Power: Choose Country Code

- 3. Reboot and connect to an AP.
- 4. Examine the current TX power indices. See Figure 18.

Figure 18: Tune TX Power: Check TX Power Indices

5. Change the power indices as you want and reboot.

[PRADA] txpwr_1 3 3 3 3 3 3 3 3 3 3 3 3 5 5 set 3333333333336 [PRADA] reboot

Figure 19: Tune TX Power: Modify TX Power Indices

- 6. Measure the Tx power value for each channel with WLAN Test equipment, such as MT8860C (Network Mode), and check the Tx power values.
- 7. Repeat each step until the Tx power values that you want are obtained.

8.1 Apply Tuned TX Power to Main Image

The following procedure describes how to set the tuned TX power indices to your Main image.

1. In the DA16200 (DA16600) SDK, open ~/FreeRTOS_SDK/core/system/src/common/main/sys_user_feature.c.

```

Figure 20: TX Power Table Source Code

- 2. The array cc_power_level contains the default values customized for FCC. Edit the power values for a specific country, or whatever countries you like with tuned values.
- 3. Re-build the SDK.
- 4. When the rebuilt software is started and the country is selected, the corresponding Tx power value that is set for the channel will take effect.

9 Tips

9.1 Find/Optimize Stack Size for Your Application

The stack size for an application may vary per application. The DA16200 (DA16600) has a tool (a console command) called ps that shows the list of threads and the status of each application stack.

Figure 21 is a snapshot of command ps when top client sample.c is run.

```
| Comparison | Com
```

Figure 21: Check Stack Size

TCPC is the name of the tread for this sample application, and the stack size is 1020 (which is defined in sample_apps.c).

Table 38: TCP Client Sample Code

Command ps shows the following information:

- Stack-B/E: the stack address
- S-Size: the stack size allocated
- Stack-L: peak usage size of the stack

To find and optimize the stack size for this application, for example if this application has four use cases, do the following:

- 1. First, over-allocate stack memory as a precaution, like 2K, "just to be safe".
- 2. Run each use case and examine the peak stack usage with command ps.
- Allocate optimal memory based on peak usage info, to find and optimize stack size (If you do not know all the possible use case scenarios, then give the stack size enough room just to be safe.).

B.2 Programming

The power level setting of all are 0x0. The power level is only the default value, so it is required to set according to the customer's specifications. the power table consists of two types. One is for OFDM and another is for DSSS. DA16200(DA16600) will refer the power_level from cc_power_level for OFDM mode and will refer from cc_power_level_dsss for DSSS mode.

In the DA16200 (DA16600) SDK, user can change the supporting "country code list" for their product. See Table 40.

FreeRTOS_SDK/apps/da6200(da16600)/get_started/src/apps/main/user_system_feature.c

Table 40: Programming Example for Country Code

```
const country ch power level t cc power level[MAX COUNTRY CNT] =
/* Country Code 1 2 3 4 5 6 7 8 9 10 11 12 13 14 */
/* Andorra */
 /* UAE */
 /* Afghanistan */
 const country ch power level t cc power level dsss[MAX COUNTRY CNT] =
/* Country Code 1 2 3 4 5 6 7 8 9 10 11 12 13 14 */
/* Andorra */
 /* UAE */
 /* Afghanistan */
```

Appendix C How to Use J-Link Debugger

See Ref. [4].

Revision History

Revision	Date	Description
1.7	11-Aug-2022	Change TLS certificate area index number of SFLASH area : #0, #1, #2, #3 → #1, #2, #3, #4 in section 3.3
1.6	14-Jun-2022	Update company name of Reference documents Update SFLASH memory map for the DA16200/DA16600 in section 3.3 Update Tx power table programming in Appendix B.2
1.5	28-Mar-2022	Update logo, disclaimer, copyright.
1.4	22-Dec-2021	Added description about fcCSP Low Power RTOS Image.
1.3	26-Nov-2021	Title was changed.
1.2	09-Nov-2021	TW Editorial.
1.1	25-Oct-2021	Added description about OTP.
1.0	13-Apr-2021	First Release.
